The direction cosines of a normal to the plane (i) are

$$\Rightarrow \lambda = \pm \sqrt{a^2 + b^2} \tan \alpha = 0$$

Putting the value of  $\lambda$  in (iii we get, eq. of plane as

 $ax + by \pm z \sqrt{a^2+b^2} \tan \alpha = 0$

Exp: We know that a number is divisible by 3 if the sum of its digits is divisibly by3.

Now out of 0, 1, 2, 3, 4, 5 if we take 1, 2, 3, 4, 5 or 0, 1, 2, 4, 5 then the 5 digit numbers will be divisible by 3.

**Case – I:** Number of 5 digit numbers formed using the digits 1, 2, 3, 4, 5 = 5! = 120

Case – II: Taking 0, 1, 2, 4, 5 if we make 5 digit number then

I place can be filled in 4 ways (0 cannot come at I place)

- II place can be filled in 3 ways
- III place can be filled in 2 ways

dvarthi

IV place can be filled in 1 ways

V place can be filled in 1 ways

 $\therefore$  Total numbers = 4 x 4! = 96

Thus total numbers divisible by 3 are = 120+96 = 216

Let

$$I = \int \frac{\cos^{3} x + \cos^{5} x}{\sin^{2} x + \sin^{4} x} dx = \int \frac{(\cos^{2} x + \cos^{4} x) \cos x}{\sin^{2} x (1 + \sin^{2} x)}$$
$$= \int \frac{\left[1 - \sin^{2} x + (1 - \sin^{2} x)^{2}\right] \cos x}{\sin^{2} x (1 + \sin^{2} x)} dx$$
$$Exp: = \int \frac{(2 - 3\sin^{2} x + \sin^{4} x) \cos x}{\sin^{2} x (1 + \sin^{2} x)} dx$$
Put sin x = t  $\Rightarrow$  cosdx = dt
$$I = \int \frac{2 - 3t^{2} + t^{4}}{t^{4} + t^{2}} dt$$
$$I = \int \left(1 + \frac{2}{t^{2}} - \frac{6}{t^{2} + 1}\right) dt = t - \frac{2}{t} - 6 \tan^{-1}(t) + C$$
$$= \sin x - 2(\sin x)^{-1} - 6 \tan^{-1}(\sin x) + C$$

Exp: The equation to the common chord of the two given circle sis

$$2x^{2} + 2y^{2} + 8x + 4y - 7 - 2(x^{2} + y^{2} - 8x - 4y - 5) = 0$$

any circle through the points of intersection of this line and the circle

 $x^{2} + y^{2} - 8x - 4y - 5 = 0$ , is of the form

$$x^{2} + y^{2} - 8x - 4y - 5 + \lambda (8x + 4y + 1) = 0$$

This meets x = 7, at points whose ordinates are given by

$$49 + y^2 - 56 - 4y - 5 + \lambda (56 + 4y + 1) = 0$$

i.e., 
$$y^2 + 4(\lambda - 1) y 57\lambda - 12 = 0$$

This quadratic has equal roots since x = 7 is to be a tangent.

$$16(λ - 1)2 - 4(57λ - 12) = 0$$
  
i.e.,  $4λ^2 - 65λ + 16 = 0 ⇒ (4λ - 1)(λ - 16) = 0$   
λ = ¼; λ = 16

for  $\lambda = \frac{1}{4}$  one circle is  $x^2 + y^2 - 8x - 4y - 5 + \frac{1}{4}(8x + 4y + 1) = 0$ 

i.e., 
$$x^{2} + y^{2} + 18x - 2y + 32 = 0$$
  
for  $\lambda = 16$ , 2nd circle is  $x^{2} + y^{2} - 8x - 4y - 5 + 16(8x + 4y + 1) = 0$   
i.e.,  $x^{2} + y^{2} + 120x - 60y + 11 = 0$

Exp: Let the required line by method  $P + \lambda Q = 0$  be

 $\therefore$  Perpendicular from (0, 0) =  $\sqrt{5}$  gives

$$\frac{1}{\sqrt{(1+2\lambda)^2 + (5-3\lambda)^2}} = \sqrt{5}$$

Squaring and simplifying

 $(8\lambda - 7)^2 = 0 \Longrightarrow \lambda = 7/8$ 

Hence the required line is

(x-3y+1)+7/8(2x+5y-9) = 0or22x+11y-55=0  $\Rightarrow$  2x+y-5=0
