

STATISTICS – II

Time Allowed : Three Hours

Maximum Marks : 200

**INSTRUCTIONS**

*Candidates should attempt FIVE questions in ALL including Questions No. 1 and 5 which are compulsory. The remaining THREE questions should be answered by choosing at least ONE question each from Section A and Section B.*

*The number of marks carried by each question is indicated against each.*

*Answers must be written only in ENGLISH.*

*(Symbols and abbreviations are as usual.)*

*Any essential data assumed by candidates for answering questions must be clearly stated.*

*Two graph sheets are attached to this question paper for answering graph-related questions. Candidate is expected to carefully detach these and attach them securely to the answer book.*

**SECTION A**

1. Attempt any *five* parts of the following : 8×5=40
- (a) Obtain the least square estimates of the parameters in a simple linear regression model, where the errors are i.i.d. normal variates. Check whether they are unbiased.

- (b) Show that  $L'\hat{\beta}$  has minimum variance in the class of linear unbiased estimators of  $L'\beta$ , if  $L'\beta$  is estimable, for the model  $(Y, X\beta, \sigma^2I)$ .
- (c) For the linear model of one way analysis of variance, derive the test for testing equality of the parameters.
- (d) Show that, a statistic  $T_n$  for  $\theta$  is consistent, if  $E(T_n) \rightarrow \theta$  and  $\text{Var}(T_n) \rightarrow 0$ , as  $n \rightarrow \infty$ .
- (e) Find the MLE for the parameter  $\theta$  based on samples from a uniform distribution over  $[\theta - Y_2, \theta + Y_2]$ .
- (f) Obtain the MVB estimator for the parameter  $\theta$  for the population

$$f(x) = \frac{1}{\theta^p \Gamma(p)} e^{-x/\theta} x^{p-1}, 0 \leq x < \infty; \text{ given } p > 0.$$

2. (a) Show that the best fitting linear function for the points  $(x_1, y_1), \dots, (x_n, y_n)$  satisfy the equation

$$\begin{vmatrix} x & y & 1 \\ \sum_i x_i & \sum_i y_i & n \\ \sum_i x_i^2 & \sum_i x_i y_i & \sum_i x_i \end{vmatrix} = 0, \quad i = 1, \dots, n.$$

10

- (b) Considering the sum of the angles is  $180^\circ$ , find the best estimates of the three angles A, B, C for the following data by the method of least squares :

$$A : 35^\circ \quad 40^\circ \quad 45^\circ$$

$$B : 60^\circ \quad 62^\circ \quad 58^\circ$$

$$C : 83^\circ \quad 80^\circ \quad 77^\circ$$

10

- (c) Obtain an unbiased estimator of  $\frac{1}{\theta}$  for

$$f(x; \theta) = \theta (1 - \theta)^{x-1}; \quad x = 1, 2, \dots; \quad 0 < \theta < 1.$$

Also, what is its distribution ?

10

- (d) If  $T_1$  is the most efficient estimator and  $T_2$  is any other estimator of  $\theta$  with efficiency 'e', show that

$$\text{Var} (T_1 - T_2) = \left(\frac{1}{e} - 1\right) \text{Var} (T_1).$$

10

3. (a) For the linear model  $Y = X\beta + \varepsilon$  and A and B matrix of constants, show that,

$$X'XA = X'XB, \text{ iff } XA = XB.$$

10

- (b) For the one-way model

$$y_{ij} = \mu + \alpha_i + l_{ij}; \quad i = 1, 2, 3; \quad j = 1, 2, \dots, n_i;$$

$E(l_{ij}) = 0$ , check whether  $\mu + \alpha_1$  and  $\alpha_1 - \alpha_3$  are estimable, when  $n_i = 4 - i$ .

10

- (c) Show that the mean square deviation  $E(\hat{\theta} - \theta)^2$  of an estimator  $\hat{\theta}$  of  $\theta$  can never fall below a positive limit, when the range is independent of  $\theta$  and the second derivative of the likelihood function exists.

10

- (d) Find the MLE for  $N$  for the hypergeometric distribution

$$f(x) = \begin{cases} \frac{\binom{M}{x} \binom{N-M}{n-x}}{\binom{N}{n}}, & \max(0, n-N+M) \leq x \leq \min(n, M) \\ 0 & , \text{ otherwise.} \end{cases}$$

10

4. (a) For the simple linear model

$$y_i = \beta_0 + \beta_1 x_i + l_i, \quad i = 1, \dots, N$$

obtain the variance of  $\hat{\beta}_1$ .

10

- (b) Write a note on Bhattacharya's bounds. Explain how it is a generalization of the Cramer - Rao inequality.

10

- (c) If two most efficient estimators is distributed in the bivariate normal form (in the limit), show that the correlation between them tends to unity.

10

- (d) Let  $X_1, \dots, X_n$  denote a sample from  $b(1, \theta)$ ,  $0 < \theta < 1$  where

$$h(\theta) = \frac{\Gamma(\alpha + \beta)}{\Gamma(\alpha) \Gamma(\beta)} \theta^{\alpha-1} (1 - \theta)^{\beta-1}, \quad 0 < \theta < 1.$$

Show that, the Bayes decision rule for the quadratic loss function, is a weighted average of the MLE of  $\theta$  and the mean  $\alpha / (\alpha + \beta)$  of the prior distribution.

10

## SECTION B

5. Attempt any *five* parts of the following : 8×5=40

- (a) Distinguish between randomized and non-randomized tests. Give an example.
- (b) Obtain the MP size  $\alpha$  test for testing  $H_0 : p = p_0$  against  $H_1 : p = p_1; p_1 > p_0$  based on a sample of size  $n$  from  $b(1, p)$ .
- (c) Explain the uses of control charts in quality control.
- (d) What is double sampling inspection plan ? Suggest the general method of plotting the OC function of such a plan.
- (e) Let  $X \sim N_p(\mu, \Sigma)$ . Find the marginal distribution of any sub vector of  $X$ .
- (f) What is the Neyman – Pearson fundamental lemma ? Explain its usefulness in Testing of Statistical Hypotheses.

6. (a) Obtain the BCR for testing  $H_0 : \sigma = \sigma_0$  against  $H_1 : \sigma = \sigma_1$  based on samples from  $N(0, \sigma^2)$ . 10
- (b) What is an unbiased test ? Give an example. 10
- (c) What do you understand by producer's risk and consumer's risk in single sampling inspection plans ? Explain their importance. 10
- (d) Find the MLE's for  $\mu$  and  $\Sigma$  for the population  $N_p(\mu, \Sigma)$ . 10

7. (a) Obtain the OC for the normal distribution with unit variance while testing  $H_0 : \theta = \theta_0$  against  $H_1 : \theta = \theta_1$ . 10
- (b) What are AOQ and AOQL ? Explain their uses. 10
- (c) Derive the null distribution of sample correlation coefficient based on samples from a bivariate normal population. 10
- (d) How will you test the equality of the components of a mean vector in a multivariate normal population ? 10
8. (a) Test the hypothesis  $H_0 : \theta = \theta_0$  against  $H_1 : \theta \neq \theta_0$  based on a sample of size  $n$  from a uniform distribution in the interval  $0 \leq x \leq \theta$ . 10
- (b) What are sequential sampling plans ? Explain one of them. 10
- (c) Obtain the distribution of the sample variance and covariance matrix in samples from a  $p$ -variate normal population. 10
- (d) What is dimension reduction technique ? (Use principal components to explain the technique.) 10
