Class 8 Important Formulas

Chapter 3 - Understanding Quadrilaterals

Delegene			
Polygons A simple closed curve made up of only line segments is called a polygon.			
Convex Polygon We have all the diagonals inside the Polygon			
we have all the diagonals inside the Polygon			
Concave Polygon			
We don't have all the diagonals inside the Polygon			
Regular and Irregular Polygons			
A regular polygon is both 'equiangular' and 'equilateral'.			
So all the sides and angles should be same			
a) So square is a regular polygon but rectangle is not			
b) Equilateral triangle is a regular polygon			
Angle Sum in the Polygons			
The Sum of the angles in the polygon is given by			
$=(n-2) \times 180^{\circ}$			
For Triangle, n=3			

So Total =180°

For quadrilateral, n=4

So total =360°

Classification of polygons

We classify polygons according to the number of sides (or vertices)

Number of sides	Classification
3	Triangle
4	Quadrilateral
5	Pentagon
6	Hexagon
7	Heptagon
8	Octagon
9	Nonagon

S.no	Terms	Descriptions
1	Quadrilateral	A quadrilateral is a four-sided polygon with four angles. There are many kinds of quadrilaterals. The five most

		common types are the parallelogram, the rectangle, the square, the trapezoid, and the rhombus.
2	Angle Property of Quadrilateral	 Sum of all the interior angles is 360° Sum of all the exterior angles is 360°
3	Parallelogram	A quadrilateral which has both pairs of opposite sides parallel is called a parallelogram. Its properties are: The opposite sides of a parallelogram are equal. The opposite angles of a parallelogram are equal. The diagonals of a parallelogram bisect each other. The adjacent angles in a parallelogram are supplementary.
4	Trapezium	A quadrilateral which has one pair of opposite sides parallel is called a trapezium.
5	Kite	It is a quadrilaterals having exactly two distinct consecutive pairs of sides of equal length Here ABCD is a Kite

7 Rectangles A parallelogram which has one of its angles a right an is called a rectangle. Properties of a rectangle are: The opposite sides of a rectangle are equal Each angle of a rectangle is a right-angle. The diagonals of a rectangle are equal.			A P
Rhombus is a parallelogram in which any pair of adjacent sides is equal. Properties of a rhombus: All sides of a rhombus are equal The opposite angles of a rhombus are equal The diagonals of a rhombus bisect each other right angles. A parallelogram which has one of its angles a right and is called a rectangle. Properties of a rectangle are: The opposite sides of a rectangle are equal Each angle of a rectangle is a right-angle. The diagonals of a rectangle are equal.			AB=BC
adjacent sides is equal. Properties of a rhombus:			AD=CD
 All sides of a rhombus are equal The opposite angles of a rhombus are equal The diagonals of a rhombus bisect each other right angles. Rectangles A parallelogram which has one of its angles a right an is called a rectangle. Properties of a rectangle are: The opposite sides of a rectangle are equal Each angle of a rectangle is a right-angle. The diagonals of a rectangle are equal. 	6	Rhombus	
is called a rectangle. Properties of a rectangle are: The opposite sides of a rectangle are equal Each angle of a rectangle is a right-angle. The diagonals of a rectangle are equal.			 All sides of a rhombus are equal The opposite angles of a rhombus are equal The diagonals of a rhombus bisect each other at
	7	Rectangles	 Properties of a rectangle are: The opposite sides of a rectangle are equal Each angle of a rectangle is a right-angle.
whose angles are right angles. Properties of square are: All the sides of a square are equal. Each of the angles measures 90°.	8	Square	 Properties of square are: All the sides of a square are equal. Each of the angles measures 90°. The diagonals of a square bisect each other at
