Chapter 7 - Triangles

| S.no	Terms	Descriptions
1	Congruence	Two Geometric figure are said to be congruence if they are exactly same size and shape Symbol used is $\cong$ Two angles are congruent if they are equal Two circle are congruent if they have equal radii Two squares are congruent if the sides are equal
2	Triangle Congruence	• Two triangles are congruent if three sides and three angles of one triangle is congruent to the corresponding sides and angles of the other • Corresponding sides are equal AB=DE , BC=EF ,AC=DF • Corresponding angles are equal $\angle A = \angle D,\ \angle B = \angle E,\ \angle C = \angle F$ • We write this as

		$ABC \cong DEF$
		• The above six equalities are between the corresponding parts of the two congruent triangles. In short form this is called **C.P.C.T** • We should keep the letters in correct order on both sides
3	Inequalities in Triangles	1) In a triangle angle opposite to longer side is larger 2) In a triangle side opposite to larger angle is larger 3) The sum of any two sides of the triangle is greater than the third side In triangle ABC AB +BC > AC

Different Criterion for Congruence of the triangles

N	Criterion	Description	Figures and expression
1	Side angle Side (SAS) congruence	• Two triangles are congruent if the two sides and included angles of one triangle is equal to the two sides and included angle • It is an axiom as it cannot be proved so it is an accepted truth	

|			
		• ASS and SSA type two triangles may not be congruent always	**If following condition** **AB=DE, BC=EF** $\angle B = \angle E$ **Then** $ABC \cong DEF$
2	Angle side angle (ASA) congruence	• Two triangles are congruent if the two angles and included side of one triangle is equal to the corresponding angles and side • It is a theorem and can be proved	 **If following condition** **BC=EF** $\angle B = \angle E, \angle C = \angle F$ **Then** $ABC \cong DEF$
3	Angle angle side(AAS) congruence	• Two triangles are congruent if the any two pair of angles and any side of one triangle is equal to the corresponding angles and side	
- It is a theorem and can be proved
If following condition

BC=EF
$\angle A = \angle D, \angle C = \angle F$

Then

$ABC \cong DEF$

| 4	Side-Side-Side (SSS) congruence	- Two triangles are congruent if the three sides of one triangle is equal to the three sides of the another

If following condition

BC=EF,AB=DE,DF =AC

Then

$ABC \cong DEF$

| 5 | Right angle – hypotenuse-side(RHS) congruence | • Two right triangles are congruent if the hypotenuse and a side of the one triangle are equal to corresponding hypotenuse and side of the another |
If following condition

AC=DF,BC=EF

Then

$$ABC \cong DEF$$

Some Important points on Triangles

Terms	Description
Orthocenter	Point of intersection of the three altitude of the triangle
Equilateral	triangle whose all sides are equal and all angles are equal to 60^0
Median	A line Segment joining the corner of the triangle to the midpoint of the opposite side of the triangle
Altitude	A line Segment from the corner of the triangle and perpendicular to the opposite side of the triangle
Isosceles	A triangle whose two sides are equal
Centroid	Point of intersection of the three median of the triangle is called the centroid of

	the triangle
In center	All the angle bisector of the triangle passes through same point
Circumcenter	The perpendicular bisector of the sides of the triangles passes through same point
Scalene triangle	Triangle having no equal angles and no equal sides
Right Triangle	Right triangle has one angle equal to 90^0
Obtuse Triangle	One angle is obtuse angle while other two are acute angles
Acute Triangle	All the angles are acute
