## Class 9 Important Formulas

## **Chapter 12 - Statistics**

S.no	Term	Description
1	Statistics	Statistics is a broad mathematical discipline which studies ways to collect, summarize, and draw conclusions from data
2	Data	A systematic record of facts or different values of a quantity is called <b>data</b> .
		Data is of two types - Primary data and Secondary data.
		<b>Primary Data</b> : The data collected by a researcher with a specific purpose in mind is called primary data.
		<b>Secondary Data</b> : The data gathered from a source where it already exists is called secondary data

4	Bar graph	A bar graph is a pictorial representation of data in which rectangular bars of uniform width are drawn with equal spacing between them on one axis, usually the x axis. The value of the variable is shown on the other axis that is the y axis.
		Days of Snow
5	Histogram	A histogram is a set of adjacent rectangles whose areas are proportional to the frequencies of a given continuous frequency distribution
6	Mean	The mean value of a variable is defined as the sum of all the values of the variable divided by the number of values. $a_m = \frac{a_1 + a_2 + a_3 + a_4}{4} = \frac{\sum_{n=0}^{n} a_n}{n}$
7	Median	The <b>median</b> of a set of data values is the middle value of the data set when it has been arranged in ascending order. That is, from the smallest value to the highest value

		Median is calculated as $\frac{1}{2}(n+1)$
		Where n is the number of values in the data If the number of values in the data set is even, then the <b>median</b> is the average of the two middle values.
8	Mode	Mode of a statistical data is the value of that variable which has the maximum frequency
