UNIT 4

- **4.2** It is because Mn^{2+} has $3d^5$ configuration which has extra stability.
- **4.5** Stable oxidation states.
 - 3d³ (Vanadium): (+2), +3, +4, and +5
 - 3*d*⁵ (Chromium): +3, +4, +6
 - 3d⁵ (Manganese): +2, +4, +6, +7

 $3d^{8}$ (Nickel): +2, +3 (in complexes)

- $3d^4$ There is no d^4 configuration in the ground state.
- **4.6** Vanadate VO_3^- , chromate CrO_4^{2-} , permanganate MnO_4^-
- **4.10** +3 is the common oxidation state of the lanthanoids

In addition to +3, oxidation states +2 and +4 are also exhibited by some of the lanthanoids.

- **4.13** In transition elements the oxidation states vary from +1 to any highest oxidation state by one For example, for manganese it may vary as +2, +3, +4, +5, +6, +7. In the nontransition elements the variation is selective, always differing by 2, e.g. +2, +4, or +3, +5 or +4, +6 etc.
- **4.18** Except Sc^{3+} , all others will be coloured in aqueous solution because of incompletely filled 3d-orbitals, will give rise to d-d transitions.
- **4.21** (i) Cr^{2+} is reducing as it involves change from d^4 to d^3 , the latter is more stable configuration

 $(t_{2\sigma}^3)$ Mn(III) to Mn(II) is from $3d^4$ to $3d^5$ again $3d^5$ is an extra stable configuration.

- (ii) Due to CFSE, which more than compensates the 3^{rd} IE.
- (iii) The hydration or lattice energy more than compensates the ionisation enthalpy involved in removing electron from d^1 .
- **4.23** Copper, because with +1 oxidation state an extra stable configuration, $3d^{10}$ results.

4.24 Unpaired electrons $Mn^{3+} = 4$, $Cr^{3+} = 3$, $V^{3+} = 2$, $Ti^{3+} = 1$. Most stable Cr^{3+}

- 4.28 Second part 59, 95, 102.

$$n \approx 5$$
, sp^3 , Cl^- weak ligand.

5.13	Aqueous $CuSO_4$ solution exists as $[Cu(H_2O)_4]SO_4$ which has blue colour due to $[Cu(H_2O)_4]^{2+}$ ions									
	(i) When KF is added, the weak H_2O ligands are replaced by F ligands, forming $[CuF_4]^{2^\circ}$ ions									
	which is a green precipitate.									
	$[Cu(H_2O)_4]^{2+} + 4F^{-}$	$\rightarrow [CuF_4]^{2-} + 4$	H ₂ O							
	(ii) When KCl is added, Cl ligands replace the weak H_2O ligands forming $[CuCl_4)^{2-}$ ions which has bright green colour.

5.14	$[Cu(H_2O)_4]^{2+} + 4 CN_4$	$N^{-} \rightarrow [Cu(CN)_{4}]^{2^{-}}$	+ 4H ₂ O							
	As CN ⁻ is a strong ligand, it forms a highly stable complex with Cu^{2+} ion. On passing H_2S , free Cu^{2+} ions are not available to form the precipitate of CuS.									
5.23	(i) $OS = +3$, $CN = 6$, $CN = 6$	d-orbital occupat	ion is $t_{2g}^{6} e_{g}^{0}$

5.28	(iii)									
5.29	(ii)									
5.30	(iii)									
5.31	(iii)									
5.32	(i) The order of the lig	gand in the spect	rochemical s	eries :						
	$H_2O < NH_3 < NO_2^-$									
	Hence the energy of	of the observed li	ght will be ir	the order :						
	$[Ni(H_2O)_6]^{2+} < [Ni(N_2O)_6]^{2+}$	$[\mathrm{NH}_{3})_{6}]^{2+} < [\mathrm{Ni}(\mathrm{NO}_{2})]^{2+}$	₆] ^{4–}							
	Thus, wavelengths	s absorbed ($E = h$	c/λ) will be i	n the opposite	order.
