# IMPORTANT QUESTIONS CLASS - 11 3+<6,\&6 CHAPTER - 2 MOTION IN A STRAIGHT LINE 

## Question 1.

A rocket is fired vertically from the ground. It moves upwards with a constant acceleration of $10 \mathrm{~ms}^{-2}$ for the $30 s$ after which the fuel is consumed. After what time from the instant of firing, the rocket will attain the maximum height? Take $\mathrm{g}=10 \mathrm{~ms}^{-2}$.

Answer:
Here, $\mathrm{a}=\mathrm{g}=1 \mathrm{~ms}^{-2}$ for $\mathrm{t}=30 \mathrm{~s}$
$\therefore \mathrm{u}=\mathrm{o}$ for first part of the motion
$\mathrm{v}=$ velocity attained by the rocket after $30 \mathrm{~s}=$ ?
$\therefore$ using the relation,
$\mathrm{v}=\mathrm{u}+\mathrm{at} . .$. (1)
we get $\mathrm{v}=0+10 \times 30$
$=300 \mathrm{~ms}^{-1}$
for second part of motion,
$\mathrm{u}=\mathrm{v}=300 \mathrm{~ms}^{-1}$
$\mathrm{v}_{1}=$ final velocity $=0$
Let t1 be the time of journey for this part of the motion,
$\therefore$ from equation (1), we get
$\mathrm{o}=300-10 \times \mathrm{t}_{1}$
Let $\mathrm{T}=$ total time of flight in which the rocket attains maximum height,
$\mathrm{T}=\mathrm{t}+\mathrm{t}_{1}$
$=30+30$
$=60$ second.

## Question

On a foggy day, two car drivers spot each other when they are just 80 m apart. They were travelling at $72 \mathrm{~km} \mathrm{~h}^{-1}$ and $60 \mathrm{~km} \mathrm{~h}^{-1}$ respectively. Both of them simultaneously apply brakes which retard both the cars at $5 \mathrm{~ms}-2$. Tell whether they will avert a collision or not?
Answer:
Here, let u , and u 2 be the initial velocities of the two cars.

If S1 and S2 be the distances covered by the two cars before coming to rest (i.e. $v=0$ ), then
using the relation,
If $S$ be the total distance covered by two cars before coming to rest, then
$\mathrm{S}=\mathrm{S}_{1}+\mathrm{S}_{2}=40+27.7=67.7 \mathrm{~m}$.
Also $\mathrm{S}_{1}=80 \mathrm{~m}$.
Now clearly the total distance covered by the cars before coming to rest is less than 80 m , so the collision will be averted.
Question 2.
A stone is dropped from a rising
balloon at a height of 76 m above
the ground and reaches the
ground in $\mathbf{6 s}$. What was the
velocity of the balloon when the
stone was dropped?
Answer:
Let $u$ be the velocity of the balloon in an upward direction at the point A = initial velocity of stone in an upward direction.

The stone rises to the top, comes to rest and then it starts coming back to the ground to hit B.

Let us take A as origin :
$\therefore$ Net vertical distance covered by the stone, $\mathrm{y}=-76 \mathrm{~m}$.
$\mathrm{a}=-\mathrm{g}=-9.8 \mathrm{~ms}^{-2}$
(Here y and acc. are taken as -ve because they are in a downward direction w.r.t. A)

$$
\begin{aligned}
& t=6 s \\
& \text { Using the relation, } \quad \mathrm{S}=\mathrm{ut}+\frac{1}{2} \mathrm{at}^{2} \\
& \text { We get, } \quad-76=\mathrm{u} \times 6-\frac{1}{2} \times 9.8 \times 6 \\
& =6 \mathrm{u}-4.9 \times 36 \\
& \text { or } \\
& u=\frac{176.4-76}{6}=\frac{100.4}{6} \\
& \text { or } \\
& \mathrm{u}=16.7 \mathrm{~ms}^{-1} \text {. }
\end{aligned}
$$

## Question 3.

A car moves at a velocity of $2.24 \mathrm{~km} \mathrm{~h}^{-1}$ in the first minute, at $3.60 \mathrm{~km} \mathrm{~h}^{\mathbf{- 1}}$ in the second minute and at $5.18 \mathrm{~km} \mathrm{~h}^{-1}$ in the third minute. Calculate the average velocity in these three minutes.

Answer:
Let $\mathrm{x}_{1}, \mathrm{x}_{2}$ and $\mathrm{x}_{3}$ be the displacements of car in 1 st , 2nd and 3rd minutes respectively and let $\mathrm{v}_{1}, \mathrm{v}_{2}$ and $\mathrm{v}_{3}$ be the velocities of these time intervals,

$\therefore \mathrm{v}_{1}=2.24 \mathrm{kmh}^{-1}, \mathrm{v}_{2}=3.60 \mathrm{kmh}^{-1}, \mathrm{v}_{3}=5.18 \mathrm{kmh}^{-1}$
time intervals $=\mathrm{t}_{1}=\mathrm{t}_{2}=\mathrm{t}_{3}=1$ minute $=160 \mathrm{~h}$

$$
\begin{array}{ll}
\therefore & \mathrm{x}_{1}=\mathrm{v}_{1} \mathrm{t}_{1}=2.24 \times \frac{1}{60} \mathrm{~km} \\
& \mathrm{x}_{2}=\mathrm{v}_{2} \mathrm{t}_{2}=\frac{3.60}{60} \mathrm{~km} \\
\text { and } & \mathrm{x}_{3}=\mathrm{v}_{3} \mathrm{t}_{3}=\frac{5.18}{60} \mathrm{~km}
\end{array}
$$

If $x$ be the total displacement, then

$$
\begin{aligned}
x & =x_{1}+x_{2}+x_{3} \\
& =\frac{2.24}{60}+\frac{3.60}{60}+\frac{5.18}{60} \\
& =\frac{11.02}{60} \mathrm{~km} \\
\text { and total time }=\quad t & =t_{1}+t_{2}+t_{3} \\
& =1+1+1=3 \text { minute }=\frac{3}{60} \mathrm{~h}
\end{aligned}
$$

If v be the average velocity in these 3 minutes, then

$$
\begin{aligned}
v & =\frac{x}{t}=\frac{\frac{11.02}{60}}{\frac{3}{60}} \\
& =\frac{11.02}{3} \mathrm{kmh}^{-1}=3.67 \mathrm{kmh}^{2}
\end{aligned}
$$

## Question 4.

A man is walking due East at the rate of $3 \mathbf{k m ~ h}^{-}$
${ }^{1}$. Rain appears to fall down vertically at the rate of $3 \mathrm{~km} \mathrm{~h}^{-1}$. Find the actual velocity and direction of the rainfall.

Answer:
Let $\mathrm{a}=$ angle made by the rainfall with the vertical
Velocity of man represented by OA due East $=3 \mathrm{~km} \mathrm{~h}^{-1}$
As rain appears to fall vertically downward, so $\mathrm{OB}=3 \mathrm{~km} \mathrm{~h}^{-1}$ represents the velocity of rain w.r.t. man. The actual velocity of rainfall is represented by OC and is given by

$$
\begin{aligned}
\mathrm{OC} & =\sqrt{\mathrm{OA}^{2}+\mathrm{OB}^{2}} \\
& =\sqrt{9+9}=3 \sqrt{2} \mathrm{kmh}^{-1}
\end{aligned}
$$

Direction of rainfall :
In rt. $\angle \mathrm{d} \triangle \mathrm{OCB}$,

$$
\begin{aligned}
\tan \alpha & =\frac{B C}{O B}=\frac{3}{3}=1 \\
\alpha & =45^{\circ}
\end{aligned}
$$

Thus the rain is actually falling at $32-\sqrt{ } \mathrm{km} \mathrm{h}^{-1}$ at an angle of $45^{\circ}$ west of the vertical.

## Question 5.

A car starting from rest and moving with uniform acceleration possesses average velocities $5 \mathrm{~ms}^{-1}$, $10 \mathrm{~ms}^{-1}$ and $15 \mathrm{~ms}^{-1}$ in the first, second and third seconds. What is the total $r$ distance covered by the car in these three seconds?

Answer:
Here, let $\mathrm{v}_{1}, \mathrm{v}_{2}$ and $\mathrm{v}_{3}$ be the average velocities
of 1 st , 2nd and 3 rd secs, respectively.
$\therefore \mathrm{v}_{1}=5 \mathrm{~ms}^{-1}, \mathrm{v}_{2}=10 \mathrm{~ms}^{-1}, \mathrm{v}_{3}=15 \mathrm{~ms}^{-1}$
$\mathrm{t}_{1}=\mathrm{t}_{2}=\mathrm{t}_{3}=1 \mathrm{~s}=$ time intervals
If $x_{1}, x_{2}$ and $x_{3}$ be the distances covered in these seconds resp., then

$$
\begin{array}{ll} 
& x_{1}=v_{1} t_{1}=5 \times 1=5 \mathrm{~m} \\
& x_{2}=v_{2} t_{2}=10 \times 1=10 \mathrm{~m} \\
\text { and } & x_{3}=v_{3} t_{3}=15 \times 1=15 \mathrm{~m} \\
\text { Let } \quad x_{2}=\text { total distance covered } \\
\therefore \quad & x
\end{array}
$$

## Question 6.

A person is running at a maximum speed of $\mathbf{3 ~ \mathbf { ~ m s }} \mathbf{- 1}$ along the length of a train to catch hold of the door of a compartment. When he is just 2.5 m from the door, the train steams off with an acceleration of $1 \mathrm{~ms}^{-2}$. Find how long it takes him to catch the door?

Answer:

Here, let $\mathrm{u}_{1}=3 \mathrm{~m} \mathrm{~s}^{-1}$, be the initial speed of man at point A.
For train $x_{1}=2.5 \mathrm{~m}=$ distance of the
train from man.
$\mathrm{u}=\mathrm{o}, \mathrm{a}=$ acceleration of train $=1 \mathrm{~ms}^{-2}$

Let C be their meeting point after a time t .
If $\mathrm{BC}=\mathrm{x}$, then usirig the relation,
$S=u t+12$ at2, we get
For train, $\mathrm{x}=0+12 \times 1 \times \mathrm{t}^{2}=0.5 \mathrm{t}^{2} \ldots$
For man, using the relation,

$$
\begin{align*}
x & =u t, \text { we get } \\
x+2.5 & =u_{1} t=3 t \tag{2}
\end{align*}
$$

$$
\begin{aligned}
& \therefore \text { From (1) and (2), we get } \\
& 0.5 t^{2}+2.5=3 t \\
& \text { or } \quad 0.5 t^{2}-3 t+2.5=0 \\
& \text { or } \quad t^{t^{2}-6 t+5}=0 \\
& \text { or } \quad(t-5)(t-1)=0 \\
& \therefore \text { either } t-1=0 \text { or } t-5=0
\end{aligned}
$$

$\therefore \mathrm{t}=1,5$ i.e. he will catch the door first after Is and then after 5 s .
$\mathrm{t}=1 \mathrm{~S}$.

## Question 7.

The displacement of a body along the $x$-axis changes according to the relation: $x$ $=20-15 t+4 t^{2}$, where $x$ is in metres, $t$ in seconds. Determine its position, velocity and acceleration at $t=0$.

Answer:
Here, $x=4 t^{2}-15 t+20 \ldots$ (1)
$\mathrm{v}=\mathrm{dxdt}=4.2 \mathrm{t}-15=8 \mathrm{t}-15 \ldots$ (2)
Also $\mathrm{a}=\mathrm{dvdt}=8$
At $t=0$, the position ( $x$ ), velocity (y) and acceleration (a) are given by
$\mathrm{x}=4.0-15 \times 0+20=20 \mathrm{~m}$
$\mathrm{v}=8 \times \mathrm{o}-15=-15 \mathrm{~ms}^{-1}$
and $\mathrm{a}=8 \mathrm{~ms}^{-2}$.
Question 25.
A body undergoes a uniformly accelerated motion. Its velocity after 5 seconds is 25 ems and after 8 seconds it is 34 cms '. Calculate the distance covered in the 12th second.
Answer:
Let $u$ and a be the initial speed and acceleration of the body.
Let $v_{1}$ and $v_{2}$ be its velocities after 5 s and 8 s respectively

Let $S_{n}$ th be the distance covered in the 12th second.
Using the relation,

$$
\mathrm{S}_{\mathrm{n}} \text { th }=\mathrm{u}+\frac{\mathrm{a}}{2}(2 \mathrm{n}-\mathrm{a})
$$

We get,

$$
\begin{aligned}
\mathrm{S}_{12} \mathrm{th} & =10+\frac{3}{2}(2 \times 12-1) \\
& =10+\frac{3}{2} \times 23 \\
& =10+34.5=44.5 \mathrm{~cm}
\end{aligned}
$$

## Value-Based Type:

## Question 8.

On a two-lane road, there are hoardings hanged on the electric poles "Save Energy". If car a is travelling at a speed of
54 km h1 and car ' $B$ ' moves with
$90 \mathrm{~km} \mathrm{~h}^{-1}$ from the opposite direction.
Now, answer these questions:
(a) Which values are depicted in the above problem? Write down the four ways by which the energy can be saved.

Answer:
Save energy to save our environment.
The four ways to save energy are as under :

1. By using CFLs, switching off appliances when not in use.
2. Saving water by using it efficiently.
3. Using solar energy.
4. By using public transport.
(b) Write a slogan on "save energy".

Answer:
Try to switch of the fans and lights when you are not using it. Use limited non renewable sources of energy.
(c) Find the velocity of B with respect to A? Also, find the velocity of the ground with respect to B?
Solution:
$\mathrm{V}_{\mathrm{A}}=+54 \mathrm{~km} \mathrm{~h}^{-1}=15 \mathrm{~ms}^{-1}$
$\mathrm{V}_{\mathrm{B}}=90 \mathrm{~km} \mathrm{~h}^{-1}=-25 \mathrm{~ms}^{-1}$
(Takingthe velocity of car A positive $\mathrm{N} v$ and car B negative)
$\therefore$ Relative velocity of B with respect to A
$=\mathrm{V}_{\mathrm{B}}-\mathrm{V}_{\mathrm{A}}=-25-15=-40 \mathrm{~ms}^{-1}$
i.e. the car Boppers to A to move with a speed $40 \mathrm{~ms}-1$ from opposite direction.

Relative velocity of ground w.r.t $\mathrm{B}=\mathrm{o}-\mathrm{V}_{\mathrm{B}}=\mathrm{o}-(-25)$
$=25 \mathrm{~ms}^{-1}$

## Question 9.

A candle march was organized by an NGO. The theme of the candle march was "No use of non-biodegradable products". The organizer made a semicircular track of radius $R$ on which peoples have to run taking a poster in their hands. If Mahesh travelled from $A$ to $B$ in time $t$ with constant speed, then answer the following:

(i) Why should non-biodegradable products not be used?

Justify your answer.
Answer:
Biodegradable products are reusable and cause less pollution.
So, non-biodegradable products must be avoided.
(ii) Find the
(a) Displacement

Answer:
Displacement $=$ minimum distance between initial and final point $=A B=2 R$
(b) Average speed

Answer:

$$
\text { AverageSpeed, } \mathrm{Y}=\frac{\text { Distance }}{\text { Time }}=\frac{\pi \mathrm{R}}{\mathrm{t}}
$$

(c) Average velocity

Answer:

$$
\text { Average velcocity }=\frac{\text { Dīsplacement }}{\text { Tine }}=\frac{2 \mathrm{R}}{\mathrm{t}}
$$

(d) Average acceleration

Answer:

$$
\begin{aligned}
\text { Averageacceleration }= & \frac{\text { Change fin velocity }}{\text { Time taken }}=\frac{2 \mathrm{~V}}{\mathrm{t}} \\
& =\frac{2 \times\left(\frac{\pi \mathrm{R}}{t}\right)}{\mathrm{t}}=\frac{2 \pi \mathrm{R}}{\mathrm{t}^{2}}
\end{aligned}
$$

## Question 10.

In sports day activities of a public
school, the lines were drawn with chalk
powder. Gagan an athlete runs a
distance of 1500 m in the following
manner, (i) Starting from rest, he accelerates himself uniformly at $2 \mathrm{~ms} \_\mathbf{1}$, till he covers a distance of 900 m . (ii) He then runs the remaining distance of 600 m at the uniform speed developed.
(i) Which value is depicted in the above problem?

## Answer:

Importance of sports activities.
(ii) Do you think that sports activities are important in day-to-day life?

Answer:
Yes, sports activities are very much important in day-to-day life as
(a) It gives break from regular life
(b) It improves physical strength
(c) It relaxes our mind and body
(d) It helps to concentrate on other works

(iii) Calculate the time taken by the athlete to cover the two parts of the distance covered.
Answer:
Let the athlete run from O to B Here, $\mathrm{OB}=1500 \mathrm{~m}$, $\mathrm{OA}=900 \mathrm{~m}, \mathrm{AB}=600 \mathrm{~m}$

Case I: From Oto A
$u=0, a=2 \mathrm{~m} / \mathrm{s}^{2}$,
$\mathrm{S}=900 \mathrm{~m}, \mathrm{t}=\mathrm{t}_{1}=$ ?
$\mathrm{V}=$ ?
$\therefore \mathrm{s}=\mathrm{ut}+\frac{1}{2} \mathrm{dt} \mathrm{t}^{2}$
$\Rightarrow 900=0 \times t+\frac{1}{2} \times 2 \times t^{2} \Rightarrow t_{1}=30 \mathrm{~S}$
Now, $v=u=a t=0+2 \times 30=60 \mathrm{~m} / \mathrm{s}$.

Case II : Taking motion of athelete from A to $\mathrm{Bu}=60 \mathrm{~m} / \mathrm{s}, \mathrm{S}=600 \mathrm{~m}, \mathrm{a}=\mathrm{o}$ ( $\because$ Speed is uniform or constant)

$$
\begin{array}{ll}
\mathrm{t}=\mathrm{t}_{2}=? & \\
\therefore & \mathrm{~S}=\mathrm{ut}_{2}+\frac{1}{2} \mathrm{at}_{2}{ }^{2} \\
& 600=60 \times \mathrm{t}_{2}+\frac{1}{2} \times 0\left(\mathrm{t}_{2}\right)^{2} \\
& \Rightarrow \quad \mathrm{t}_{2}=\frac{600}{60}=10 \mathrm{~S}
\end{array}
$$
